

1. 证明: 当 $x > 1$ 时, $e^x > ex$

方法 $\rightarrow$ 寻找 $\frac{f(b)-f(a)}{b-a}$ $\rightarrow b > a$

$$e^x - e > e(x-1)$$

$$\frac{e^x - e}{x-1} > e \quad \text{令 } f(t) = e^t \quad t \in (1, x) \text{ 将 } t \text{ 看做变量}$$

x 看做常数

$$\frac{f(b)-f(a)}{b-a} = \frac{e^x - e}{x-1} = f'(\xi) = e^\xi > e$$

$$\therefore e^x - e > ex - e \quad \therefore e^x > ex$$

2. 设 $f(x)$ 在 $[0, 1]$ 上连续, $(0, 1)$ 上可导, 且 $f(0) = f(1)$

证明: 存在不同的 $\xi, \eta \in (0, 1)$, 使 $f'(\xi) + f'(\eta) = 0$

分析: "不同的" 指分别位于不同区间

存在 $\xi \in (0, c)$ $\eta \in (c, 1)$ 使 $f'(\xi) + f'(\eta) = 0$

$$\text{由拉氏定理, } f'(\xi) = \frac{f(c) - f(0)}{c} \quad f'(\eta) = \frac{f(1) - f(c)}{1-c}$$

$$\because f(0) = f(1) \quad \therefore f'(\eta) = \frac{f(0) - f(c)}{1-c}$$

$$f'(\xi) + f'(\eta) = 0 \quad \text{即} \quad \frac{f(c) - f(0)}{c} + \frac{f(0) - f(c)}{1-c} = 0$$

$$\therefore c = \frac{1}{2}$$

证明: 存在 $\xi \in (0, \frac{1}{2})$ $\eta \in (\frac{1}{2}, 1)$

$$\text{由拉氏定理 } f'(\xi) = \frac{f(\frac{1}{2}) - f(0)}{\frac{1}{2}} \quad f'(\eta) = \frac{f(1) - f(\frac{1}{2})}{\frac{1}{2}}$$

$$f'(\xi) + f'(\eta) = 2[f(\frac{1}{2}) - f(0) + f(1) - f(\frac{1}{2})] = 0$$

3. 设 $f(x)$ 在区间 $[a, b]$ 上连续, (a, b) 上可导

证明: $\xi \in (a, b)$ 使 $f(b) - f(a) = \xi f'(\xi) \ln \frac{b}{a}$

$$\frac{f(b) - f(a)}{\ln b - \ln a} = \frac{f'(\xi)}{\frac{1}{\xi}} \rightarrow \text{柯西}$$

4. $f(x)$ 在 $[0, 1]$ 上可导, 且 $f(0) = 0$, $f(1) = 1$ 证明:

1) 存在 $t \in (0, 1)$, $f(t) = 1 - t$

2) 存在不同的 $\xi, \eta \in (0, 1)$ $f'(\xi)f'(\eta) = 1$

分析: 1) 令 $F(x) = f(x) + x - 1$ $x \in [0, 1]$

2) 分两个区间分别操作

证明 1) 令 $F(x) = f(x) + x - 1$ $F(0) = f(0) - 1 = -1 < 0$ $F(1) = f(1) = 1 > 0$

$\therefore F(0)F(1) < 0$ 由零点定理, $f(t) = 1 - t$

2) $\xi \in (0, c)$ $\eta \in (c, 1)$

由拉氏定理 $f'(\xi) = \frac{f(c) - f(0)}{c - 0}$ $f'(\eta) = \frac{f(1) - f(c)}{1 - c}$

$$f'(\xi)f'(\eta) = \frac{f(c)[1 - f(c)]}{c(1 - c)} = 1$$

由 1) $f(c) = 1 - c$ 令 $c = t$ $f(c) = 1 - c$

$$f'(\xi)f'(\eta) = \frac{(1 - c)c}{c(1 - c)} = 1$$
