

第68讲 微元法思想

忆当年, 当时的3个问题, 用了

四步曲. 即求一个分布在 $[a, b]$ 上的量

Q 的值, 仍用 Q 表示 (且总量 $Q = \sum_{i=1}^n \Delta Q_i$)

1. 分割: 在 $[a, b]$ 内插入 $n-1$ 个分点.

$a = x_0 < x_1 < x_2 < \dots < x_{n-1} < x_n = b$

相应地分成 n 个小区间.

$[x_{i-1}, x_i]$ $i=1, 2, 3, \dots, n$ 设 $x_i - x_{i-1} = \Delta x_i$

$\lambda = \max \{ \Delta x_i \mid 1 \leq i \leq n \}$ 相应地分成 n 个部分量

ΔQ_i ($i=1, 2, \dots, n$)

2. 取近似 $\forall \xi_i \in [x_{i-1}, x_i]$ $\Delta Q_i \approx f(\xi_i) \Delta x_i$
($i=1, 2, \dots, n$)

3. 作和. $Q = \sum_{i=1}^n \Delta Q_i \approx \sum_{i=1}^n f(\xi_i) \Delta x_i$

4. $\lim_{\lambda \rightarrow 0} \sum_{i=1}^n f(\xi_i) \Delta x_i = Q$

若 $f(x)$ 在 $[a, b]$ 上可积.

知 $\lim_{\lambda \rightarrow 0} \sum_{i=1}^n f(\xi_i) \Delta x_i = \int_a^b f(x) dx$

$$\therefore Q = \int_a^b f(x) dx \quad \checkmark$$

Q 分布在 $[a, b]$ $\forall \xi_i \in [x_{i-1}, x_i]$

$\Delta Q_i \approx f(\xi_i) \Delta x_i$ ($\Delta Q \approx f(x) dx$)

$\therefore Q = \int_a^b f(x) dx$

令 $x_{i-1} = x$ $x_i = x + \Delta x = x + dx$

取 $x \in [x, x + dx]$

$\Delta Q \approx f(x) dx$

$\therefore Q = \int_a^b f(x) dx$

若 $y = f(x)$ 在 x 处可微, 即

$\Delta y = A \Delta x + o(\Delta x)$ (A 是与 Δx 无关的常数)

$= f'(x) \Delta x + o(\Delta x)$

$= f'(x) dx + o(dx)$ ($\Delta x \rightarrow 0$)

$= dy + o(dx)$

$\Delta y \approx dy$

当 $f'(x) \neq 0$ 时

$$\lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{f'(x) \Delta x + o(\Delta x)}{f'(x) \Delta x}$$

$$= \lim_{\Delta x \rightarrow 0} \left[1 + \frac{1}{f'(x)} \frac{o(\Delta x)}{\Delta x} \right]$$

$$= 1$$

$\therefore \Delta y \sim dy$ ($\Delta x \rightarrow 0$)

$\Delta Q \approx f(x) dx = dQ$

微元法

求分布在区间 $[a, b]$ 上的量 Q

的值, 仍用 Q 表示. ($Q = \sum_{i=1}^n \Delta Q_i$)

1. 选取 $[x, x+dx] \subset [a, b]$ ($dx > 0$)

$$\Delta Q \approx f(x)dx = dQ$$

$$\text{或 } dQ = f(x)dx$$

$$2. Q = \int_a^b f(x)dx$$

称为微元分析法, 或简称为微元法.

第69讲 定积分的应用.

一. 求平面图形的面积.

1. 求曲线 $y=f_2(x)$, $y=f_1(x)$ (均连续)

$x=a$, $x=b$ ($a < b$) 围成的平面图形面积 S 为

$$S = \int_a^b |f_2(x) - f_1(x)| dx$$

证明: S 分布在 $[a, b]$ 上

取 $[x, x+dx] \subset [a, b]$

($dx > 0$)

当 dx 极小, 上下几乎与 x 轴平行

$$\Delta S \approx |f_2(x) - f_1(x)| dx = dS$$

$$\therefore S = \int_a^b |f_2(x) - f_1(x)| dx$$

2. $y=f(x)$ 连续, $x=a$, $x=b$ ($a < b$) x 轴

围成的平面图形面积

$$S = \int_a^b |f(x)| dx$$

若图像已知

$$\int_a^c f(x)dx - \int_c^b f(x)dx = S$$

3. 曲线 $x=\varphi_2(y)$, $x=\varphi_1(y)$ 连续

$y=c$, $y=d$ ($c < d$) 围成平面图形面积

$$S = \int_c^d |\varphi_2(y) - \varphi_1(y)| dy$$

$$S = \int_c^d (\varphi_2(y) - \varphi_1(y)) dy$$

4. $x=\varphi(y)$ (连续) y 轴, $y=c$, $y=d$ ($c < d$)

围成的图形面积.

$$S = \int_c^d |\varphi(y)| dy$$

$$S = \int_c^a -\varphi(y)dy + \int_h^a \varphi(y)dy$$

画图的步骤.

1. 若边界曲线是两条曲线, 先求出两条曲线的交点, 在平面上找出这些点. 画经过交点的边界曲线, 从而画出了平面图形.

2. 若边界曲线超过两条, 先画边界曲线. 画的过程中求出交点, 从而画出平面图形.

3. 选择以 x 为自变量或以 y 为自变量
用定积分计算.

例: 求曲线 $y = \frac{1}{x}$, $y = x$, $x = 2$
围成的平面图形面积.

$$\begin{aligned}\text{解: } S &= \int_1^2 (x - \frac{1}{x}) dx \\ &= (\frac{1}{2}x^2 - \ln x) \Big|_1^2 \\ &= \frac{3}{2} - \ln 2\end{aligned}$$

解法二: $S_1 + S_2 = \int_{\frac{1}{2}}^1 (2 - \frac{1}{y}) dy + \int_1^2 (2 - y) dy$

例: 求曲线 $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, ($a > 0, b > 0$)
围成的平面图形面积.

$$y = b\sqrt{1 - \frac{x^2}{a^2}}$$

解法一:

$$S = 4 \int_0^a b\sqrt{1 - \frac{x^2}{a^2}} dx$$

$$\text{令 } x = a \sin t$$

$$\begin{aligned}S &= 4 \int_0^{\frac{\pi}{2}} ab \cos^2 t dt \\ &= 4ab I_2 \\ &= 4ab \cdot \frac{1}{2} \times \frac{\pi}{2} \\ &= \pi ab\end{aligned}$$

解法二: $S = 4 \int_0^a y dx$

$$\begin{cases} x = a \cdot \cos t \\ y = b \cdot \sin t \end{cases}$$

$$S = 4 \int_0^{\frac{\pi}{2}} y dx$$

$$\begin{aligned}x &= a \cos t \\ y &= b \sin t\end{aligned} \quad -4 \int_{\frac{\pi}{2}}^0 ab \cdot \sin^2 t dt$$

$$= 4ab \int_0^{\frac{\pi}{2}} \sin^2 t dt$$

$$= 4ab I_2 \quad (\text{也可降幂})$$

$$= \pi ab$$

特别地, $a = b = R > 0$ 时

$$S = \pi R^2$$

第 70 讲 曲边扇形面积

二. 求曲线 $r = r(\theta)$ (连续) 与 $\theta = \alpha, \theta = \beta$ ($\alpha < \beta$)
围成的曲边扇形面积.

$$S = \frac{1}{2} \int_{\alpha}^{\beta} r^2(\theta) d\theta$$

证: S 分布在 $[\alpha, \beta]$ 上

1. 选取 $[\theta, \theta + d\theta] \subset [\alpha, \beta]$ ($d\theta > 0$).

$$\Delta S \approx \frac{1}{2} r^2(\theta) d\theta = dS$$

$$\therefore S = \frac{1}{2} \int_{\alpha}^{\beta} r^2(\theta) d\theta$$

三. 求夹在两平行平面间立体的体积

$$S = \int_a^b |f(x)| dx$$

(x处线段的高度在[a, b]上的积分)

证: 由 V 分布在 $[a, b]$ 上, 选取 $[x, x+dx] \subset [a, b]$ ($dx > 0$)

$\Delta V \approx A(x) dx = dV$ (柱体)

$V = \int_a^b A(x) dx$

祖暅原理: 幂势既同, 则积不容异

$$V_1 = \int_a^b A_1(x) dx = \int_a^b A_2(x) dx = V_2$$

第71讲

平面图形绕 x 轴、y 轴旋转所成旋转体的体积

四. 求旋转体体积

1. 求曲线 $y=f(x)$ 连续与 $x=a, x=b$ ($a < b$) x 轴围成的平面图形, 绕 x 轴旋转所成旋转体的体积 V_x

$$V_x = \int_a^b \pi f^2(x) dx$$

例:

2. 求曲线 $y=f(x)$ 连续, $x=a, x=b$
($0 \leq a < b$) 与 x 轴围成的平面图形
绕 OY 轴旋转所成旋转体的体积.

$$V_y = \int_a^b 2\pi x |f(x)| dx$$

证: 由 V_y 分布在 $[a, b]$, 选取

$$[x, x+dx] \subset [a, b]$$

$$\Delta V_y \approx \pi(x+dx)^2 |f(x)| - \pi x^2 |f(x)|$$

$$\Delta V_y \approx 2\pi x |f(x)| dx + \pi |f(x)| \cdot dx \cdot dx$$

若 $y=f(x)$ 在 x 处可微 $\Leftrightarrow$

$$\Delta y = A \cdot \Delta x + o(\Delta x)$$

$$= dy + o(\Delta x) \quad (\Delta x \rightarrow 0)$$

$$\Delta y \approx dy$$

$$\therefore dx = \Delta x$$

$$\lim_{\Delta x \rightarrow 0} \frac{\pi |f(x)| \Delta x^2}{\Delta x} = 0$$

$$\therefore \pi |f(x)| \Delta x^2 = o(\Delta x)$$

$$\therefore \Delta V_y \approx 2\pi x |f(x)| dx = dV_y$$

$$V_y = \int_a^b 2\pi x |f(x)| dx$$

$$= 2\pi \int_a^b x |f(x)| dx$$

例: 求曲线 $y = \sin x$ ($0 \leq x \leq \pi$) 与 x 轴围成的平面图形.

(1) 求该平面图形绕 OY 轴旋转所成旋转体的体积 V_y

(2) 绕 OY 轴 V_y

$$\begin{aligned} \text{解: (1)} \quad V_y &= \pi \int_0^\pi \sin^2 x dx \\ &= \pi \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sin^2 x dx \\ &= 2\pi \int_0^{\frac{\pi}{2}} \sin^2 x dx \\ &= 2\pi \cdot \frac{1}{2} \times \frac{\pi}{2} \\ &= \frac{\pi^2}{2} \end{aligned}$$

$$\begin{aligned} (2) \quad V_y &= 2\pi \int_0^\pi x |\sin x| dx \\ &= 2\pi \int_0^\pi x \sin x dx \\ &\quad (\text{分部积分}) \end{aligned}$$

$$V_y = \pi \int_0^1 (\pi - \arcsin y)^2 dy - \pi \int_0^1 (\arcsin y)^2 dy$$

例: 求曲线 $y = (x-1)(x-2)$ 与 x 轴围成的平面图形

绕 OY 轴旋转所成旋转体体积 V_y .

$$\begin{aligned} \text{解: } V_y &= 2\pi \int_1^2 x |(x-1)(x-2)| dx \\ &= -2\pi \int_1^2 (x^3 - 3x^2 + 2x) dx \end{aligned}$$

第 12 讲

曲线的弧长

五. 求曲线的弧长

1. 分割: 分成 n 段子弧 $\widehat{M_{i-1}M_i}$ ($i=1, 2, \dots, n$)

2. 取近似: $|M_{i-1}M_i|$

3. 作和 $\sum_{i=1}^n |M_{i-1}M_i|$

4. 取极限: 设 $\lambda = \max\{|M_{i-1}M_i| \mid i=1, 2, \dots, n\}$

$\lim_{\lambda \rightarrow 0} \sum_{i=1}^n |M_{i-1}M_i|$ (极限存在且唯一) $\triangleq S$

称弧 $\widehat{AB}$ 是可求长的, 且 S 就是 $\widehat{AB}$ 的弧长. 否则称 $\widehat{AB}$ 是不可求长的.

若弧 $\widehat{AB}$ 是可求长的.

设 $\Gamma_{AB}: \begin{cases} x = x(t) \\ y = y(t) \end{cases} \quad \widehat{AB} \text{ 的弧长为 } S$
($\alpha \leq t \leq \beta$)

由 S 分布在 $[\alpha, \beta]$ 取 $[t, t+dt] \subset [\alpha, \beta]$

$$\begin{aligned} \Delta S &= |\widehat{M} \Delta| \approx |M \Delta| \\ &= \sqrt{[x(t+dt) - x(t)]^2 + [y(t+dt) - y(t)]^2} \\ &= \sqrt{[x'(t)dt]^2 + [y'(t)dt]^2} \end{aligned}$$

($x'(t), y'(t)$ 在 $[\alpha, \beta]$ 上存在)

$$\begin{aligned} &= \sqrt{[x'(\xi_1)]^2 [dt]^2 + [y'(\xi_2)]^2 [dt]^2} \\ &= \sqrt{[x'(\xi_1)]^2 + [y'(\xi_2)]^2} dt \end{aligned}$$

($t < \xi_1, \xi_2 < t+dt$)

($x'(t), y'(t)$ 在 $[\alpha, \beta]$ 上连续)

$$= \sqrt{[x'(t)]^2 + [y'(t)]^2} dt + \left(\sqrt{[x'(\xi_1)]^2 + [y'(\xi_2)]^2} - \sqrt{[x'(t)]^2 + [y'(t)]^2} \right) dt$$

$$\begin{aligned} &\approx \sqrt{[x'(t)]^2 + [y'(t)]^2} dt \quad (\text{当 } dt \rightarrow 0 \text{ 时, 高阶无穷小可忽略}) \\ &= ds \end{aligned}$$

$$\therefore \frac{ds}{dt} = \sqrt{[x'(t)]^2 + [y'(t)]^2}$$

总结:

若 $\Gamma_{AB}: \begin{cases} x = x(t) \\ y = y(t) \end{cases} \quad \alpha \leq t \leq \beta$

且 $x'(t), y'(t)$ 在 $[\alpha, \beta]$ 上连续, 则

$$S = \int_{\alpha}^{\beta} \sqrt{[x'(t)]^2 + [y'(t)]^2} dt$$

(1) $y = f(x) \quad x \in [a, b] \quad f(x)$ 连续

$$\begin{cases} y = f(x) \\ x = x \end{cases} \quad S = \int_a^b \sqrt{1 + [f'(x)]^2} dx$$

(2) $x = \varphi(y) \quad y \in [c, d] \quad \varphi(y)$ 连续

$$S = \int_c^d \sqrt{1 + [\varphi'(y)]^2} dy$$

(3) $r = r(\theta) \quad \theta \in [\alpha, \beta] \quad r'(\theta)$ 连续

$$\begin{cases} x = r(\theta) \cos \theta \\ y = r(\theta) \sin \theta \end{cases} \quad \begin{aligned} x'(\theta) + y'(\theta) &= \\ r^2(\theta) + r'(\theta)^2 &= \end{aligned}$$

$$S = \int_{\alpha}^{\beta} \sqrt{r^2(\theta) + r'(\theta)^2} d\theta$$

(4) $\theta = \theta(r) \quad r \in [a, b] \quad \theta'(r)$ 连续

$$\begin{cases} x = r \cdot \cos \theta(r) \\ y = r \cdot \sin \theta(r) \end{cases}$$

$$S = \int_a^b \sqrt{x'^2(r) + y'^2(r)} dr$$

例: 求曲线 $x^2 + y^2 = R^2$ 的周长 S

解: $\begin{cases} x = R \cos \theta \\ y = R \sin \theta \end{cases} \quad 0 \leq \theta \leq 2\pi$

$$S = \int_0^{2\pi} \sqrt{(-R \sin \theta)^2 + (R \cos \theta)^2} d\theta$$

$$= R \int_0^{2\pi} d\theta$$

$$= 2\pi R$$

$$ds = \sqrt{[x'(t)]^2 + [y'(t)]^2} dt \quad \frac{ds}{dt} = \sqrt{x'(t)^2 + y'(t)^2}$$

$$ds = \sqrt{1 + f'(x)^2} dx \quad \frac{ds}{dx} = \sqrt{1 + f'(x)^2}$$

$$ds = \sqrt{1 + \varphi'(y)^2} dy \quad \frac{ds}{dy} = \sqrt{1 + \varphi'(y)^2}$$

$$ds = \sqrt{r'^2(\theta) + r^2(\theta)} d\theta \quad \frac{ds}{d\theta} = \sqrt{r'^2(\theta) + r^2(\theta)}$$

弧长微分公式

$$ds^2 = (x'(t)^2 + y'(t)^2)(dt)^2$$

$$= x'(t)^2(dt)^2 + y'(t)^2(dt)^2$$

$$= dx^2 + dy^2$$

弧长微分公式的几何意义.

$$\tan \theta = \frac{PT}{MP}$$

$$= \frac{PT}{dx}$$

$$\tan \theta = f'(x)$$

$$\Rightarrow PT = f'(x) dx$$

$$= dy$$

$$\Delta y = PQ$$

$$= PT + TR$$

$$= dy + o(dx)$$

$$\therefore TR = o(dx)$$

$$(dx \rightarrow 0, \Delta x = dx)$$

$$\Delta y \approx dy = PT$$

$$ds^2 = dx^2 + dy^2 = |MP|^2 + |PT|^2 = |MT|^2$$

$$\therefore ds = MT, \quad \widehat{MO} = \Delta s \approx ds = |MT|$$

第13讲 平面图形绕 x 轴旋转所成侧面积. 这积分在物理中的应用.

六. 求旋转体的侧面积.

求曲线 $y=f(x)$ ($f(x)$ 连续) 与

$x=a, x=b$ ($a < b$), x 轴围成的平面图形绕 ox 轴旋转, 所得旋转体的侧面积

解: S_x 分布在 $[a, b]$ 上

取 $[x, x+dx] \subset [a, b]$

$$\Delta S_x \approx 2\pi |f(x)| \cdot dx = dS_x$$

$$\therefore S_x = 2\pi \int_a^b |f(x)| dx \quad (\times)$$

正确解法: S_x 分布在 $[a, b]$ 上
(圆面)

取 $[x, x+dx] \subset [a, b]$

$$\Delta S_x \approx \pi |f(x) + f(x+dx)| \Delta s$$

$$\approx \pi \cdot 2 |f(x)| ds$$

$$= 2\pi |f(x)| \sqrt{1 + f'(x)^2} dx$$

$$= dS_x$$

$$\therefore S_x = \int_a^b 2\pi |f(x)| \sqrt{1 + f'(x)^2} dx$$

($dx = ds$)

$$\text{由于 } \lim_{\Delta x \rightarrow 0} \frac{2\pi |f(x)| \sqrt{1 + f'(x)^2} \Delta x - 2\pi |f(x)| \Delta x}{\Delta x}$$

$$= 2\pi |f(x)| (\sqrt{1 + f'(x)^2} - 1) \neq 0$$

$$(f(x) \neq 0, f'(x) \neq 0)$$

例: 半径为R的球面的面积

解: 由 $x^2 + y^2 = R^2$ 确定的 $y = y(x)$

两侧同时对 x 求导

$$2x + 2yy' = 0 \quad y' = -\frac{x}{y}$$

$$S = \int_{-R}^R 2\pi |y| \sqrt{1 + \frac{x^2}{y^2}} dx$$

$$= \int_{-R}^R 2\pi |y| \cdot \frac{R}{|y|} dx$$

$$= 2\pi R \int_{-R}^R dx$$

$$= 4\pi R^2$$

$$S_{表} = S_{侧} + S_{底} + S_{顶}$$

$$S_{表} = S_{侧} + S_{底}$$

$$S_{表} = S_{侧}$$

七. 物理中的应用.

1. 求变力做功.

例: 一个半径为10m的半球形水池.

装满水. 水的密度(比重)为

$w \text{ t/m}^3$. 现在要把水池中的水

提到水池上方20m高处的水箱中

问: 抽完全部的水, 至少做功

多少?

解: 如图建立坐标系.

半圆方程为

$$x^2 + y^2 = 10^2$$

$$y = \sqrt{100 - x^2}$$

所作的功 w 分存在 $[0, 10]$ 上

取 $[x, x+dx] \subset [0, 10]$

$$\Delta W \approx \pi(100 - x^2)dx \cdot w \cdot 10^3 g (x+20)$$

$$= 10^3 \pi w g (100 - x^2)(x+20) dx$$

$$= dW$$

$$\therefore W = 10^3 \pi w g \int_0^{10} (100 - x^2)(x+20) dx$$

2. 求压力.

例: 一个半圆形的闸门垂直浸入水中.

闸门的直径在水平面上, 水的密度(比重)

$\rho \text{ kg/m}^3$. 闸门半径为1m. 求闸门一侧所

受压力.

解: 如图建立坐标系.

设所受压力为 F .

F 分存在 $[0, 1]$ 上.

取 $[x, x+dx] \subset [0, 1]$

$$\Delta F \approx 2 \cdot \sqrt{1 - x^2} dx (\rho x g) = dF$$

$$\text{即 } dF = 2\rho g x \sqrt{1 - x^2} dx$$

$$F = 2\rho g \int_0^1 x \sqrt{1 - x^2} dx$$

$$= -\rho g \int_0^1 (1 - x^2)^{\frac{1}{2}} d(1 - x^2)$$

$$= -\frac{2}{3} \rho g \left[(1 - x^2)^{\frac{3}{2}} \right]_0^1$$

$$= \frac{2}{3} \rho g \text{ (N)}$$

3. 求细棒的质量.

有一个细棒位于 x 轴的区间 $[a, b]$ 上.

若 $\lim_{\Delta x \rightarrow 0} \frac{\Delta M}{\Delta x}$ (存在), 该极限值
称为细棒 L 在 x 处的线密度.

若细棒每一点的线密度均相等.

称细棒为均质细棒. 设细棒的

密度为 μ , 则 $\frac{M}{L} = \mu$. $M = L \cdot \mu$.

(L 为细棒的长度) 否则称细棒是
不均质的.

例: 有一个细棒位于 $[a, b]$ 上, 在 x 处的

密度为 $\mu = f(x)$. 求细棒的质量 M

解: 由 M 分布在 $[a, b]$ 上, 取 $[x, x+dx] \subset [a, b]$

$$\Delta M \approx f(x) dx = dM. \therefore M = \int_a^b f(x) dx$$

4. 求引力问题.

有一个细棒 L 位于区间 $[a, b]$ 上, 它的密度函数

$\mu = f(x)$ 连续. 有一个质点 A 位于 x_0 . 点质量为 m .

求 L 对 A 点引力.

解: 设引力的大小为 F .

由 F 分布在 $[a, b]$ 上.

取 $[x, x+dx] \subset [a, b]$

把这一段细棒看成在 x 处, 质量为 $f(x) dx$.

$$\Delta F \approx k \cdot \frac{f(x) dx \cdot m}{|x - x_0|^2} = dF.$$

$$\therefore F = km \int_a^b \frac{f(x)}{(x - x_0)^2} dx.$$

方向由 A 点指向 L .

$$\alpha \leq \theta \leq \beta$$

$$dA = \frac{1}{2} r^2(\theta) d\theta$$

$$A = \int_{\alpha}^{\beta} \frac{1}{2} r^2(\theta) d\theta$$

$$dA = \frac{1}{2} [r_1^2(\theta) - r_2^2(\theta)] d\theta$$

$$A = \int_{\alpha}^{\beta} \frac{1}{2} [r_1^2(\theta) - r_2^2(\theta)] d\theta$$

$$A = \int_{\alpha}^{\beta} \frac{1}{2} r^2(\theta) d\theta$$

$$A = 2 \int_{\pi}^{2\pi} \frac{1}{2} [a(1+\cos\theta)]^2 d\theta$$

$$\int_{\pi}^{2\pi} \cos^2 \theta d\theta = 0$$

$$\int_0^{\pi} \cos^2 \theta d\theta = 2 \int_0^{\frac{\pi}{2}} \cos^2 \theta d\theta$$

$$r^2 = a^2 \cos 2\theta$$

$$\cos 2\theta \geq 0$$

$$-\frac{\pi}{4} \leq \theta \leq \frac{\pi}{4}$$

$$\text{或 } \frac{3\pi}{4} \leq \theta \leq \frac{5\pi}{4}$$

$$A = 4 \int_0^{\frac{\pi}{4}} \frac{1}{2} a^2 \cos 2\theta d\theta$$

$$= a^2 \sin 2\theta \Big|_0^{\frac{\pi}{4}} = a^2$$

$$r = ae^{\theta} \quad (\theta = \pi)$$

$$A = \int_{-\pi}^{\pi} \frac{1}{2} (ae^{\theta})^2 d\theta$$

$$= \frac{1}{4} a^2 e^{2\pi} - e^{-2\pi}$$

$$r = \sqrt{2} \sin \theta \quad r^2 = \cos 2\theta$$

$$2 \int_0^{\frac{\pi}{6}} \frac{1}{2} (\sqrt{2} \sin \theta)^2 d\theta$$

$$+ 2 \int_{\frac{\pi}{6}}^{\frac{\pi}{4}} \frac{1}{2} \cos 2\theta d\theta$$

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

绕 X 轴

$$V = 2V_1 = 2 \int_0^a \pi y^2 dx = \frac{4\pi}{3} a^2 b$$

$$\frac{4\pi}{3} ab^2$$

绕 Y 轴

$$V = 2V_1 = 2 \int_0^b \pi x^2 dy = \frac{4\pi}{3} ab^2$$

$$\text{椭球: } \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \leq 1$$

$$V = \frac{4}{3} \pi abc$$

扫描全能王 创建

$$x = a(t - \sin t)$$

$$y = a(1 - \cos t)$$

$$V = \int_0^{2\pi a} \pi y^2 dx$$

$$= \int_0^{2\pi} \pi [a(1 - \cos t)]^2 d[act - sint]$$

$$= \int_0^{2\pi} \pi [a(1 - \cos t)]^2 d[act - sint]$$

$$dy = 2\pi x |f(x)| dx$$

绕 y 轴

$$V_y = \int_0^{2\pi} 2\pi a(t - \sin t) a(1 - \cos t) d[act - sint]$$

非旋转体

$$S(x) = \frac{1}{2} \cdot (2\sqrt{R^2 - x^2}) h$$

$$V = \int_{-R}^R \frac{1}{2} \cdot 2\sqrt{R^2 - x^2} \cdot h dx$$

$$\frac{r}{R} = \frac{h-x}{h} \quad r = \frac{h-x}{h} R$$

$$S(x) = \pi R^2 \frac{(h-x)^2}{h^2} dx$$

$$V = \int_0^h \frac{\pi R^2}{h^2} (x-h)^2 dx = \frac{1}{3} \pi R^2 h$$
